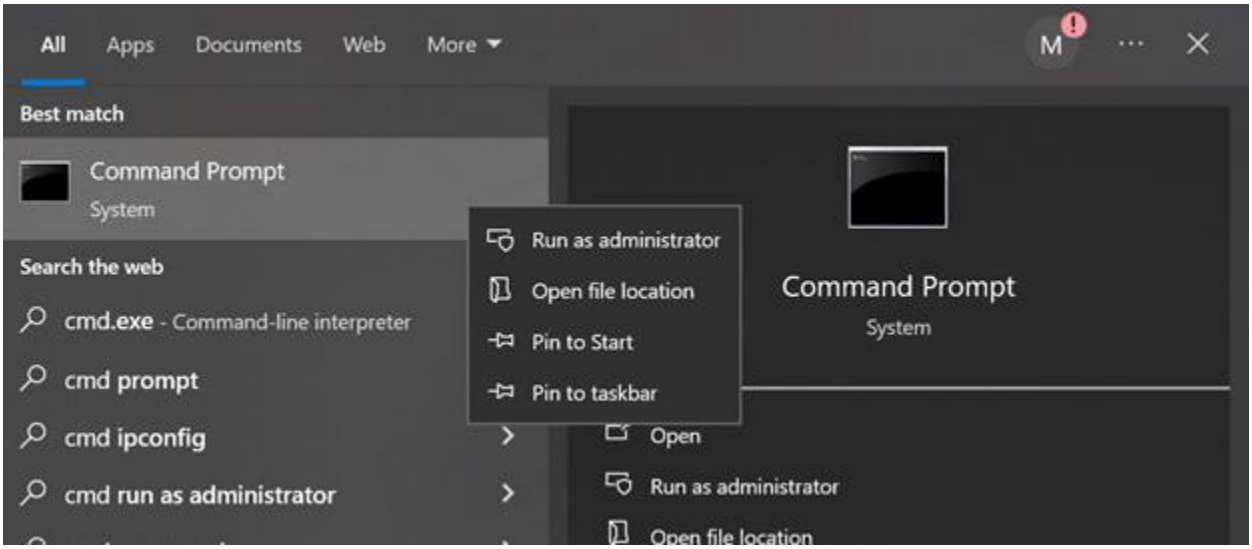
How to create a Windows desk top short cut for the command window

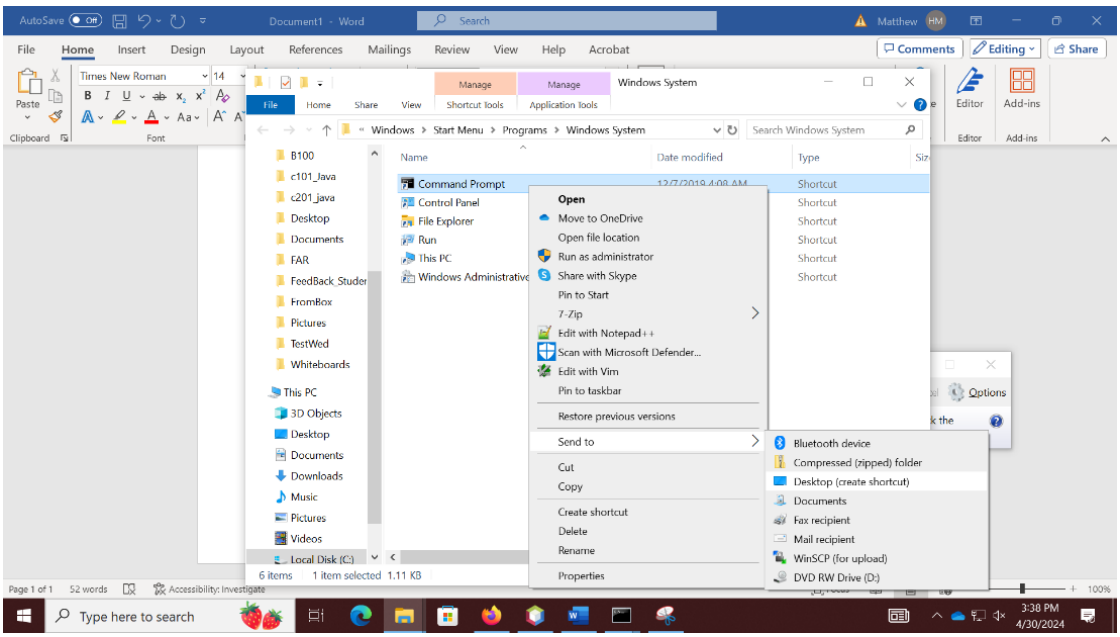
Follow these steps:

1) In the search bar, bottom left of windows screen, type in “cmd” or “command prompt”.

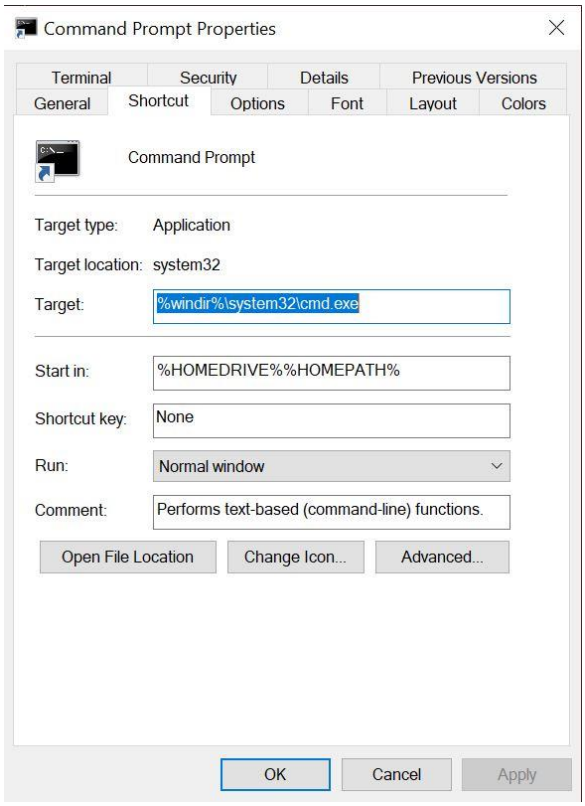
2) Then right click on the “Command Prompt” option at the top, see picture below, and select “Open file location”.



3) Then select “Command Prompt”, right click it, hover over “Send to” and then click “Desktop (create shortcut)”. This will create a desk top short cut to open the command window. Small problem is when you double click it to open up, the default location is not what you want.



4) To change this starting location, right click on the “Command Prompt” icon and select “Properties”. When you do this a dialog box will open as shown below.



5) In the “Start in:” section, you need to enter the full path where you want to this command shell to open up. For my example it is

```
C:\Java\Programs\build\classes
```

Go ahead and type in your complete path.

6) Then click “OK”. Now every time to double click the “Command Prompt” icon on the desk top it will take you to the correct location.
