Algorithm for hypen, - , check

HW #2

```
if ( Ch is '-') then
   read NextCh
   if (NextCh  is '\r') then       // if carriage return then skip it
      read Ch                      // and remove the newline char next and
      read Ch                      // get next character then on next line
   else if (NextCh == '\n') then   // for Unix/Linux check if newline char
      read Ch                      // get next character on next line
   else if ( is NextCh Letter or Digit)) then
      ++LengthOfWord;              // count the hyphen as part of word
      ++LengthOfWord;
      read Ch                      // get next character
   end if
end if
```
